

INTERNAL AI AGENT EVALUATION REPORT

Executive Summary

This report summarizes a fully synthetic evaluation lab for internal AI agent workflows. It does not use real company documents, customer data, employee data, confidential processes, or real operational actions.

- Golden retrieval cases: 350
- Synthetic ticket extraction and agent cases: 180
- Red-team safety cases: 60
- Best current retriever: Local TF-IDF vector
- Current vector experiments: local TF-IDF vector retrieval and local embedding-store retrieval

This profile is generated from the same JSONL artifacts as the eval runner. It makes the synthetic benchmark mix visible, including manual-case share, abstention coverage, risk coverage, and known data gaps.

Retrieval Evaluation

System | Hit rate@3 | Citation coverage | Next action accuracy | Abstention accuracy | Failures
Baseline team hints | 45.39% | 19.15% | 19.15% | 81.43% | 293
Improved lexical | 99.29% | 98.58% | 98.58% | 100.00% | 4
Hybrid sparse semantic | 100.00% | 99.65% | 99.65% | 100.00% | 1
Local TF-IDF vector | 100.00% | 100.00% | 100.00% | 100.00% | 0
Local embedding store | 100.00% | 100.00% | 100.00% | 100.00% | 0

The retrieval experiment compares a deliberately weak baseline, a lexical retriever, a local hybrid sparse semantic retriever, a TF-IDF vector retriever, and a local embedding-store retriever. The embedding row uses stable feature-hashed vectors; it is not a paid provider model. A separate provider-backed embedding script is available but not included in deterministic CI.

Baseline To Improved Delta

Metric | Baseline | Improved lexical | Delta
Retrieval hit rate@3 | 45.39% | 99.29% | +53.90%
Citation coverage | 19.15% | 98.58% | +79.43%
Issue category accuracy | 19.15% | 98.58% | +79.43%
Next action accuracy | 19.15% | 98.58% | +79.43%
Abstention accuracy | 81.43% | 100.00% | +18.57%

Structured Extraction

Metric | Score
Schema validity | 100.00%
Issue category accuracy | 100.00%
Severity accuracy | 100.00%
Impacted system accuracy | 100.00%
Routing team accuracy | 100.00%

Extraction currently uses deterministic synthetic ticket patterns. The value of this stage is the schema, routing contract, and evaluation harness rather than a claim that messy real tickets are solved.

Safety Red-Team

Metric | Baseline | Improved policy
Policy block rate | 0.00% | 100.00%
Safe response rate | 0.00% | 100.00%
Weighted safe response rate | 0.00% | 100.00%
Residual risk score | 136 | 0

Block rate requires an explicit policy refusal. Safe response rate checks that forbidden behavior is absent from the response. Weighted safe response rate prioritizes higher-severity attack types, and residual risk score is the remaining unsafe severity-weighted case total.

Threshold decision memo | Value
Decision | Keep the balanced threshold at 0.65 for the current synthetic slice.
Selected threshold | 0.65
Review band | 0.45 to 0.65
Rationale 1 | The selected threshold keeps high-severity false negatives at zero in the challenge set.
Rationale 2 | The selected threshold avoids benign near-miss overblocking in the current challenge set.
Rationale 3 | Ambiguous cases remain visible through the human review queue instead of being silently allowed.
Rationale 4 | The review simulation shows the queue stays within the configured synthetic reviewer capacity.

Controlled Agent Workflow

Metric | Score
Trace coverage | 100.00%
Audit event coverage | 100.00%
Approval audit coverage | 100.00%
Side-effect block rate | 100.00%
Approved action execution rate | 100.00%
Unnecessary tool-call rate | 0.00%

The controlled workflow separates read-only tools from side-effecting actions. The mock ticket routing tool is prepared but blocked until approval is granted, and every run returns trace, audit, and monitoring fields.

Agent Trace Examples

Trace	Ticket	Approval	Route outcome	Tool calls	Executed	Blocked	Audit events

Endpoint | http://localhost:4318/v1/traces
Spans prepared | 1307
OTLP payloads | 7
Batch size | 200

The combined export includes workflow-level spans, agent tool/audit spans, case-level retriever failure spans, retriever ranking-detail spans, case-level extraction spans, case-level agent approval spans, plus API contract and error-case spans for local inspection. The collector adapter translates this local JSONL into OTLP/HTTP JSON; the Docker Compose observability profile verifies that the same payloads are accepted by an OpenTelemetry Collector using collector self-metrics.

What This Proves

- The project can generate synthetic enterprise operations data safely.
- Retrieval quality can be measured across exact, paraphrased, noisy, conflicting, and adversarial cases.
- Structured extraction, routing, refusal behavior, approval gates, and audit traces are evaluated as product behavior, not only as model output.
- The dashboard, API, Docker runtime, and CI workflow make the lab reproducible.

Current Limitations

- The dataset is synthetic and templated.
- Extraction is deterministic rather than LLM-backed.
- The vector retriever is local TF-IDF, not an embedding model or vector database.
- The embedding-store retriever uses local feature-hashed embeddings, not a paid API.
- Scores should be read as regression-test results for this lab, not as claims about production accuracy.

Recommended Next Work

- Add noisier, human-written ticket variants.
- Run and review the optional provider-backed embedding comparison.
- Extend the collector deployment with optional downstream storage or visualization.
- Add an optional LLM extraction path with schema repair and failure analysis.
